Birth Rate and the Cyprus Economy

How falling fertility shaped the island's economy, what it is doing now, and what it means for the decades ahead. Research brief + 90-second short-form video script (in Greek).

Executive summary

Bottom line: Cyprus went from about 3.5 children per woman in the early 1960s to 1.4 today, and has been below the 2.1 replacement level since 1995. The large cohorts born up to the early 1990s powered the economy's rise into a services, tourism and finance hub. Today those smaller cohorts that follow mean the economy grows only because of migration: in 2024 net migration (13,588) added about four and a half times as many people as natural increase (about 3,000). Looking ahead, fewer workers per retiree will push up spending on pensions, health and long-term care, and slow growth, unless productivity, female and older-worker participation, and well-managed migration fill the gap.

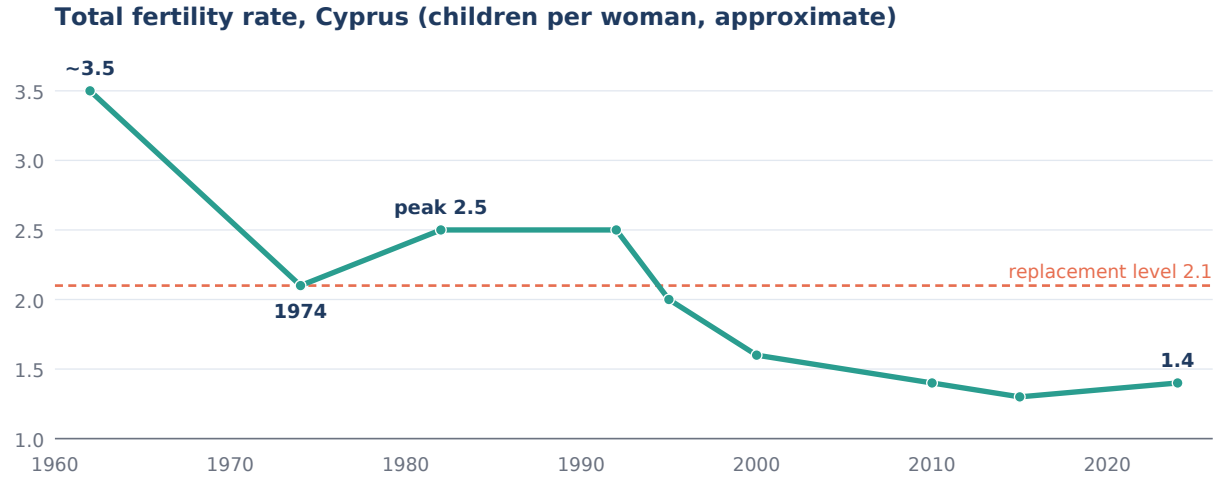

- **Past (1960s to 2000s):** high, then moderate, fertility created a demographic dividend: many young workers and few retirees. Their entry into the labour market, together with rising female employment and EU accession in 2004, supported fast growth.
- **Present (2010s to 2026):** fertility is stuck at 1.3 to 1.4; births fell to 9,766 in 2024. People aged 65+ (18.3%) now outnumber children under 15 (15.2%). The labour market is very tight (unemployment 4.1%, job-vacancy rate around 3%) and roughly one in four workers is foreign.
- **Future (to 2070 and beyond):** the old-age dependency ratio is projected to roughly double, from about 24 to about 46 people aged 65+ per 100 of working age by 2070. Eurostat expects the population to keep growing until about 2060 (to ~1.15 million) only thanks to migration, then shrink.
- **Policy:** a 2024 government package raised birth allowances to €1,000 / €1,500 / €2,000 for the 1st / 2nd / 3rd child, plus monthly support for young mothers, longer parental leave and extended childcare hours. A first-pillar pension reform is planned for 2027 to 2031.

Key numbers at a glance

Indicator	Value	Year / source
Total fertility rate	1.4 children per woman (replacement = 2.1)	2024, Cystat
Peak fertility since 1974	2.5	1982, Cystat
Below replacement since	1995	Cystat
Live births	9,766 (down from 10,241 in 2023)	2024, Cystat
Crude birth rate	10.0 per 1,000 people	2024, Cystat
Mean age of mother at first birth	30.4 years	2024, Cystat
Population (government-controlled area)	~983,000 (+1.7%)	end 2024, Cystat
Natural increase vs. net migration	~3,000 vs. 13,588	2024, Cystat (natural increase derived: births minus 6,753 deaths)

Indicator	Value	Year / source
Children under 15 / people 65+	15.2% / 18.3% (were 22.3% / 11.3% in 2000)	2024, Cystat
Births to foreign-born mothers	about 23%	2023, reported in Cyprus press
Foreign workers in the labour force	about 24% (EU + third-country nationals)	2023, Labour Force Survey
Unemployment / job-vacancy rate	4.1% / ~3% (one of EU's highest vacancy rates)	Q3 2025
Real GDP growth	3.4% (2024); ~3% forecast for 2025	European Commission
Old-age dependency ratio (65+ per 100 aged 15-64)	23.8 (2019) to 46.3 (2070)	Eurostat baseline projection
Average age young people leave home	27.2 years	Eurostat, 2024

1. The past: how birth rates built the modern economy

Anchor points compiled from Cystat, the World Bank and the US Library of Congress country study; intermediate years are smoothed, so read the line as a trend, not exact annual values.

1.1 Post-war development and the first fertility decline (1946 to 1973)

Cyprus's fertility was already falling after the Second World War. The crude birth rate dropped from about 32 per 1,000 in 1946 to about 25 in the 1950s and about 18 in the early 1970s. The main driver was rapid post-war economic development: urbanisation, more schooling (especially for girls), better child survival and a shift from farming to wage work, all of which raise the cost of raising children and lower the need for large families. Even so, women still had roughly 3.5 children each in the early 1960s, so the population was young and growing.

1.2 The 1974 shock

The Turkish invasion of 1974 displaced about a third of the population and caused large-scale emigration. Fertility and births fell sharply (the birth rate dropped to about 16 per 1,000) and the population actually shrank in 1973 to 1976 (about -0.9% a year). Economically this was a huge loss of land, tourism capacity and workers.

1.3 The 1980s rebound and the demographic dividend

As the economy recovered, so did births. Fertility rose to a post-1974 peak of 2.5 in 1982 and stayed around 2.4 to 2.5 into the early 1990s, at the time one of the highest levels in Western Europe. These large cohorts matter for the economy today: people born from the late 1970s to

the early 1990s entered the labour market in the late 1990s and 2000s. At the same time, female employment rose and Cyprus joined the EU (2004) and the euro (2008).

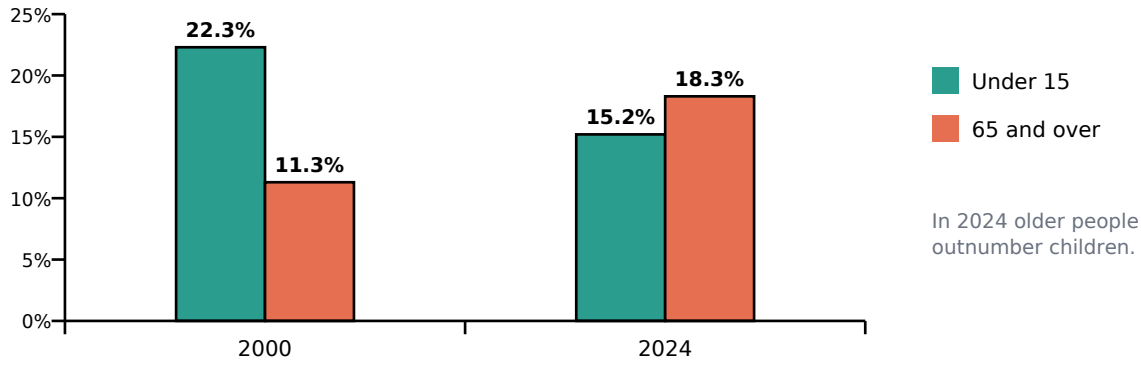

This combination is what economists call a **demographic dividend**: a large share of the population is of working age, while there are relatively few children and retirees to support. It supported the construction boom, the growth of tourism, banking, shipping and business services, and strong tax and social-insurance revenue. In 2000 people aged 65+ were only 11.3% of the population and children were 22.3%.

1.4 Below replacement since 1995

From the mid-1990s fertility fell below 2.1 and kept sliding to about 1.6 by 2000 and about 1.3 to 1.4 in the 2010s. The drivers were the classic ones for a high-income country: later marriage, longer education, more women in careers, higher housing costs and childcare costs. The 2012 to 2013 banking crisis, with unemployment peaking above 15%, pushed many young people to delay family formation or to emigrate, deepening the trough.

2. The present: a growing but ageing economy that runs on migration

Share of population: children vs. people 65+ (Cystat)

Source: Statistical Service of Cyprus (Cystat), government-controlled area.

2.1 Fewer babies, older mothers

In 2024 there were 9,766 births, down 4.6% from 10,241 in 2023, giving a crude birth rate of 10.0 per 1,000. The fertility rate stayed at 1.4. The average mother is 30.4 years old at her first birth and 31.6 at any birth. Later first births leave less time for second and third children, which is a main reason completed family size falls. About a quarter of births (23% in 2023) are to foreign-born mothers, so immigration already supports the birth count.

2.2 Growth now comes from migration, not births

The population rose 1.7% in 2024 to about 983,000. Of the increase of roughly 16,600 people, only about 3,000 came from more births than deaths (9,766 births minus 6,753 deaths); the rest, 13,588, came from net migration. Without migration, Cyprus's population would be close to flat today and would begin to fall as the large older cohorts age.

2.3 A labour market that cannot find workers

Unemployment fell to 4.1% by the third quarter of 2025 and the job-vacancy rate, at around 3%, is one of the highest in the EU. Employers in tourism, construction, agriculture, care and IT report that they cannot fill posts locally. EU citizens and third-country nationals together make up about 24% of the workforce, and in 2023 the Labour Minister said the economy "would collapse without migrants". He also stressed that even a sudden rise in births would leave about two decades of labour shortage, because a baby born today only enters the labour market around 2045.

2.4 Pressure on public finances is already visible

The Social Insurance Fund still runs surpluses, but the state has borrowed heavily from it (a debt of roughly €12 to €14 billion has been reported). A first-pillar pension reform is being debated in 2026, with higher pensions phased in from 2027 to 2031, while employers argue that raising the retirement age should be considered instead of only raising contributions. The Fiscal Council has warned that how the reform is financed remains open.

2.5 Why young Cypriots have fewer children

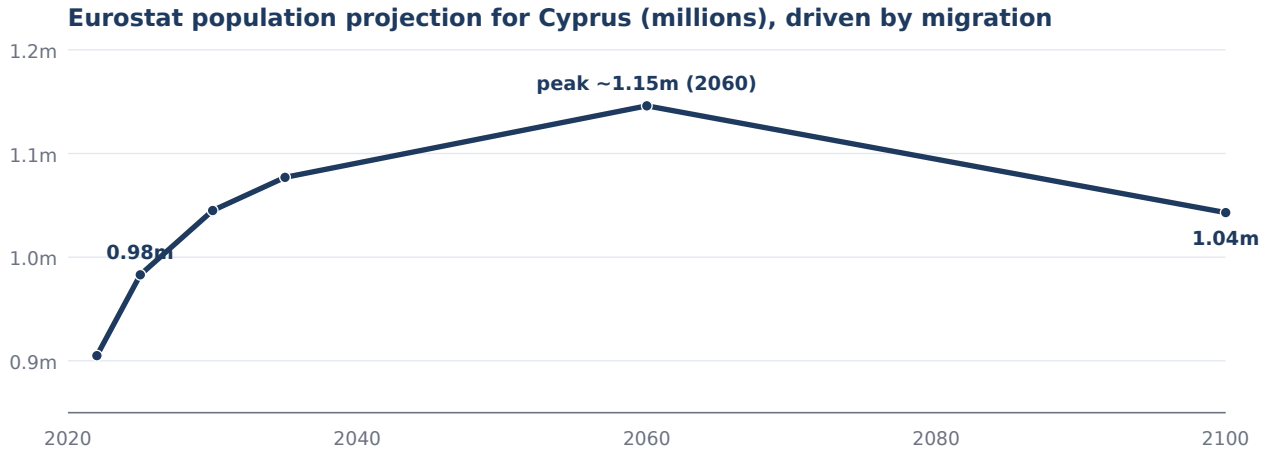

- **Housing:** young people leave the parental home at 27.2 on average, among the latest in the EU; in several areas rents now exceed the monthly income of young households.
- **Cost of living:** prices accelerated again in 2026 (an energy shock that local commentators link to the war involving Iran), squeezing budgets.
- **Work-life balance and childcare:** long hours, limited affordable nursery places and long school holidays make a second or third child hard to combine with two careers.
- **Later partnership:** longer studies (often abroad) and career-building push first births past age 30.

Note: no Cyprus-specific survey proving these causes was found; they are the drivers most often reported locally and match international evidence.

3. How low fertility affects the economy: the main channels

Channel	What happens	Effect on Cyprus
Labour supply	Smaller cohorts reach working age every year; the large 1980s cohorts start retiring from the 2040s.	Chronic shortages; growth depends on importing workers; wage pressure in low-supply sectors.
Pensions	Fewer contributors per pensioner.	Rising pension spending as a share of GDP; pressure on the Social Insurance Fund after 2040s.
Health and long-term care	More people aged 75+, with more chronic illness.	Higher GHS (GeSY) and care costs; demand for foreign care workers.
Growth and productivity	GDP = workers x output per worker. If workers stop growing, only productivity can lift GDP.	Need for digitalisation, skills, R&D; risk of slower potential growth.
Public budget	Ageing costs rise while the tax base grows more slowly.	Less room for investment; possible higher taxes, contributions or later retirement.
Housing and consumption	Household formation slows; demand shifts to smaller homes and services for older people.	Near term: demand driven by migrants and foreign buyers; long term: weaker demand in rural areas.
Education	Fewer pupils, especially in villages.	School mergers and closures; spare capacity can be redirected to quality and adult training.
Regional balance	Young people concentrate in Nicosia and Limassol.	Ageing, emptying villages; pressure on rural services.
Innovation and entrepreneurship	Older societies tend to start fewer new firms.	Need to attract young talent and returning diaspora.

4. The future: what the projections say

Eurostat projections reported in Cyprus media (2025 base): 983k (2025), 1.045m (2030), 1.077m (2035), ~1.146m peak (2060), ~1.043m (2100). The 2022 starting value (905k) is from the earlier EUROPOP2023 projection.

4.1 Fewer workers per retiree

Eurostat's baseline projection has Cyprus's old-age dependency ratio rising from 23.8 people aged 65+ per 100 of working age (2019) to 46.3 by 2070. Put simply: today there are almost **four** people of working age for every person over 65; by 2070 there will be only about **two**. Projections are long-range and depend heavily on migration assumptions, so treat the exact numbers as indicative.

4.2 Ageing costs

The European Commission's 2018 Ageing Report projected Cypriot public pension spending rising from 8.5% of GDP (2016) to 10.4% (2070). The 2024 Ageing Report revised Cyprus's long-term projection sharply upwards: according to the ECB, Cyprus had the second-largest upward revision in the EU (about 6 percentage points of GDP higher by 2070 than in the previous exercise), partly due to new demographic and macroeconomic assumptions. Health and long-term care costs come on top. A 2020-based ILO actuarial review judged the Social Insurance Fund viable to about 2080 under its assumptions, but that depends on continued strong employment and migration.

4.3 Three scenarios to 2050

Scenario	Assumptions	Economic outcome
A. Managed migration + productivity	Fertility ~1.4-1.5; steady, well-integrated migration; higher participation of women and over-60s; productivity growth.	Population ~1.1m; growth 2-3%; ageing costs manageable.
B. Drift (status quo)	Fertility ~1.3-1.4; migration volatile; low productivity growth.	Growth slows towards 1-1.5%; rising pressure on pensions and health; recurring labour shortages.
C. Low migration	Fertility stays low and migration falls sharply (politics, regional instability).	Working-age population shrinks; potential growth near zero; higher taxes or lower benefits needed.

5. Policy responses and what works

5.1 What Cyprus is doing

- **Birth allowance (2024 package):** raised from €628 to €1,000 (1st child), €1,500 (2nd) and €2,000 (3rd).
- **Young mothers:** €200 a month for 24 months for mothers under 30 having their first child.

- **Parental leave:** extra leave extended from 8 to 10 weeks (2nd child) and 12 weeks (3rd child), from March 2025.
- **Childcare:** pilot of nursery and day-care hours until 19:30; subsidies for large employers (100+ staff) that open nurseries.
- **Large families:** income and property limits on child benefit removed for families with five or more children; IVF support.
- **Overall:** a plan of over €100 million in phases. Unions (PEO) criticised it as insufficient on childcare and housing.
- **Church of Cyprus:** a separate programme (from 2025) paying €1,500 at baptism and €1,000 at each school stage for third and later children, with religious and citizenship conditions.
- **Labour and pensions:** new legal routes for foreign workers as irregular arrivals fell; first-pillar pension reform targeted for January 2027.

5.2 What the international evidence suggests

Studies across Europe find that one-off cash bonuses usually have small and often temporary effects: they can bring births forward more than they raise the total number of children. Lasting effects are more often linked to affordable, full-day childcare, secure jobs, flexible work for both parents, and affordable housing for young families. No rich country has returned to 2.1 through policy alone, so the realistic goal is to close part of the gap between the children people want and the children they have, while also adapting the economy to ageing.

5.3 Implications

- **For government:** prioritise housing for young couples, childcare capacity and integration of migrants; link pension age to life expectancy; stop borrowing from the Social Insurance Fund.
- **For businesses:** invest in automation and training; offer flexible work and on-site childcare; plan for an older workforce and customer base.
- **For families and young people:** the cost of a child is the core issue: support that reduces the cost of housing and time (not only money) matters most.
